

Insight 1 — Two products carry the entire business Latte (22.81%) and Americano with Milk (21.34%) together represent **44% of all sales**. If this café removed these two drinks, it would lose nearly half its revenue. Espresso is the weakest performer at only 3.64% — the café could consider dropping it or promoting it more aggressively.

So *what?* A café manager seeing this should double down on Latte availability and never let it run out of stock.

Insight 2 — The business has two revenue peaks, not one Looking at your line chart, revenue peaks in **February–March** and again in **October**. It then drops significantly in April–May and again in November–December. This is not a typical seasonal pattern — most cafés peak in winter only.

So *what?* The café should investigate what drives the October spike — is it a promotion, an event, back-to-school season? If they know the cause, they can replicate it.

Insight 3 — Nights are busiest, mornings are slowest Your Time of Day chart shows Night generates the most revenue (~40K), followed by Afternoon, then Morning as the slowest. This is the **opposite of most cafés worldwide** which peak in the morning.

So *what?* This café likely serves a younger or evening crowd. Morning promotions or breakfast offers could unlock an untapped revenue opportunity.

Insight 4 — The business is entirely cashless 100% of 3,547 transactions were paid by card. Zero cash.

So *what?* This signals either a very deliberate business decision or a tech-savvy customer base. Either way it simplifies operations and reduces cash handling risk.
